

ABSTRACT

A multipurpose dispenser is provided. The multipurpose dispenser comprises two deposits and having different products and means for dispensing each of them simultaneously or alternatively. A control plate controls two motors. The first motor
5 transmits its movement via gears to a pusher element which acts on a push-button arranged at the exit to the valve of deposit, dispensing the contents of the deposit either in a dropwise manner to channels or pipes, or by spraying it outside through a window created for this purpose in the dispenser cover, and the second motor drives a fan that circulates air containing the product held in deposit that is evaporated by a
10 cord, the air exiting to the outside via gratings according to the rotation direction of the fan.
